

Predator		Prey	
			

How has a mole **adapted** to its **environment**?

Moles have bad eyesight as they spend so much time underground. Their other senses are much stronger.

How do you know if an animal is...

- A mammal?
- A bird?
- A reptile?
- An amphibian?
- A fish?
- An insect?

Moles have big, strong front paws which act like shovels to help them dig quickly.

As moles can't see very well, they have whiskers at the tip of their nose to help them feel what is ahead.

**living**

**non-living**

**never alive**
