

Plants are living things, so they need certain things to survive:

Air: Plants breathe, just like humans.

Soil: Food for plants. There are lots of nutrients in soil.

Light: Sunshine also provides food for plants.

Water: The roots take in water from the soil.

Space: Plants can't grow unless they have space.

If plants don't have the right conditions to grow, they won't look healthy.

Some plants can grow in extreme places. Cactuses and succulents can grow in the desert where there is very little water.

Plants can also grow in cold places, under the water and on mountain tops.

Seeds and bulbs grow into plants.
